Receiver selection

Sideline | Implementation snapshot: October 11, 2026

The working Flask page lets a user choose a season, week and two receivers. This is a local implementation screenshot.

Projected PPR

Sideline | Implementation snapshot: October 11, 2026

THE PROJECTED EDGE

Projected edge: Davante Adams by 9.32 PPR points, conditional on both receivers playing.

Check injury and lineup status before setting your lineup. A projection is an estimate, not a guarantee.

Davante Adams

LA vs SF · Week 1

13.19

projected PPR points

4.68 receptions + 60.76 yards + 0.36 TDs

Illustrative error range 6.44–19.95 PPR. Based on historical validation errors, not a player-specific confidence interval.

Matthew Golden

GB vs MIN · Week 1

3.87

projected PPR points

1.44 receptions + 17.17 yards + 0.11 TDs

Illustrative error range 0.00–10.62 PPR. Based on historical validation errors, not a player-specific confidence interval.

The comparison

Recent = last 3 prior appearances. Longer history = up to 8 prior appearances.

Pregame evidence	Davante Adams	Matthew Golden
Recent targets / game	6.67	2.33
Target share · recent	20.5%	15.4%
Offensive snap participation · recent	54.7%	61.3%
Target trend · recent minus longer history	-0.71	-0.29
Catch rate · longer history	57.6%	52.4%
Receiving yards / target	6.66	5.33

The API returns Adams 13.19 and Golden 3.87 for 2026 Week 1. The recommendation follows the forecast and can be wrong.

Statistics comparison

projected PPR points

4.68 receptions + 60.76 yards + 0.36 TDs

Illustrative error range 6.44–19.95 PPR. Based on historical validation errors, not a player-specific confidence interval.

projected PPR points

1.44 receptions + 17.17 yards + 0.11 TDs

Illustrative error range 0.00–10.62 PPR. Based on historical validation errors, not a player-specific confidence interval.

The comparison

Recent = last 3 prior appearances. Longer history = up to 8 prior appearances.

Pregame evidence	Davante Adams	Matthew Golden
Recent targets / game	6.67	2.33
Target share · recent	20.5%	15.4%
Offensive snap participation · recent	54.7%	61.3%
Target trend · recent minus longer history	-0.71	-0.29
Catch rate · longer history	57.6%	52.4%
Receiving yards / target	6.66	5.33
Air yards / game · recent	89.33	21.00
Air-yard share · longer history	34.4%	13.6%
Yards after catch / reception	1.41	2.36
Drops / targets · covered games	1.7%	4.8%
Red-zone targets / game · recent	2.00	0.00
Red-zone target share · longer history	33.3%	0.0%
Opponent WR PPR allowed / game	30.96	19.09
Opponent passing EPA allowed / attempt	0.12	-0.34
Prior appearances in history	8.00	8.00

The table shows opportunity, efficiency and opponent context. Snap percentage represents playing time and differs from route percentage.

Methodology and limitations

Sideline | Implementation snapshot: October 11, 2026

Air yards / game · recent	89.33	21.00
Air-yard share · longer history	34.4%	13.6%
Yards after catch / reception	1.41	2.36
Drops / targets · covered games	1.7%	4.8%
Red-zone targets / game · recent	2.00	0.00
Red-zone target share · longer history	33.3%	0.0%
Opponent WR PPR allowed / game	30.96	19.09
Opponent passing EPA allowed / attempt	0.12	-0.34
Prior appearances in history	8.00	8.00

What favors each receiver

- Davante Adams has the higher recent targets per game.
- Davante Adams has the higher target share.
- Matthew Golden has the higher offensive snap participation.
- Davante Adams has the higher red-zone target share.

These are comparisons of the inputs. They are not calculated explanations of each feature's contribution to the model.

Know the limits

- Route participation and targets per route are unavailable.
- Historical weather forecasts and pregame injuries are not integrated.
- Snap participation measures offensive plays, not routes.
- The model can miss offseason changes in a receiver's role.

▾ How we calculate and test the projection

We predict receptions, receiving yards, touchdowns, and other scoring contributions using a random forest trained on 2023–2024. We convert those estimates to full PPR. Target trends enter as features rather than an arbitrary boost.

2025 validation: 2585 player-games. Enhanced average miss 4.22 PPR points. Baseline average miss 4.21.

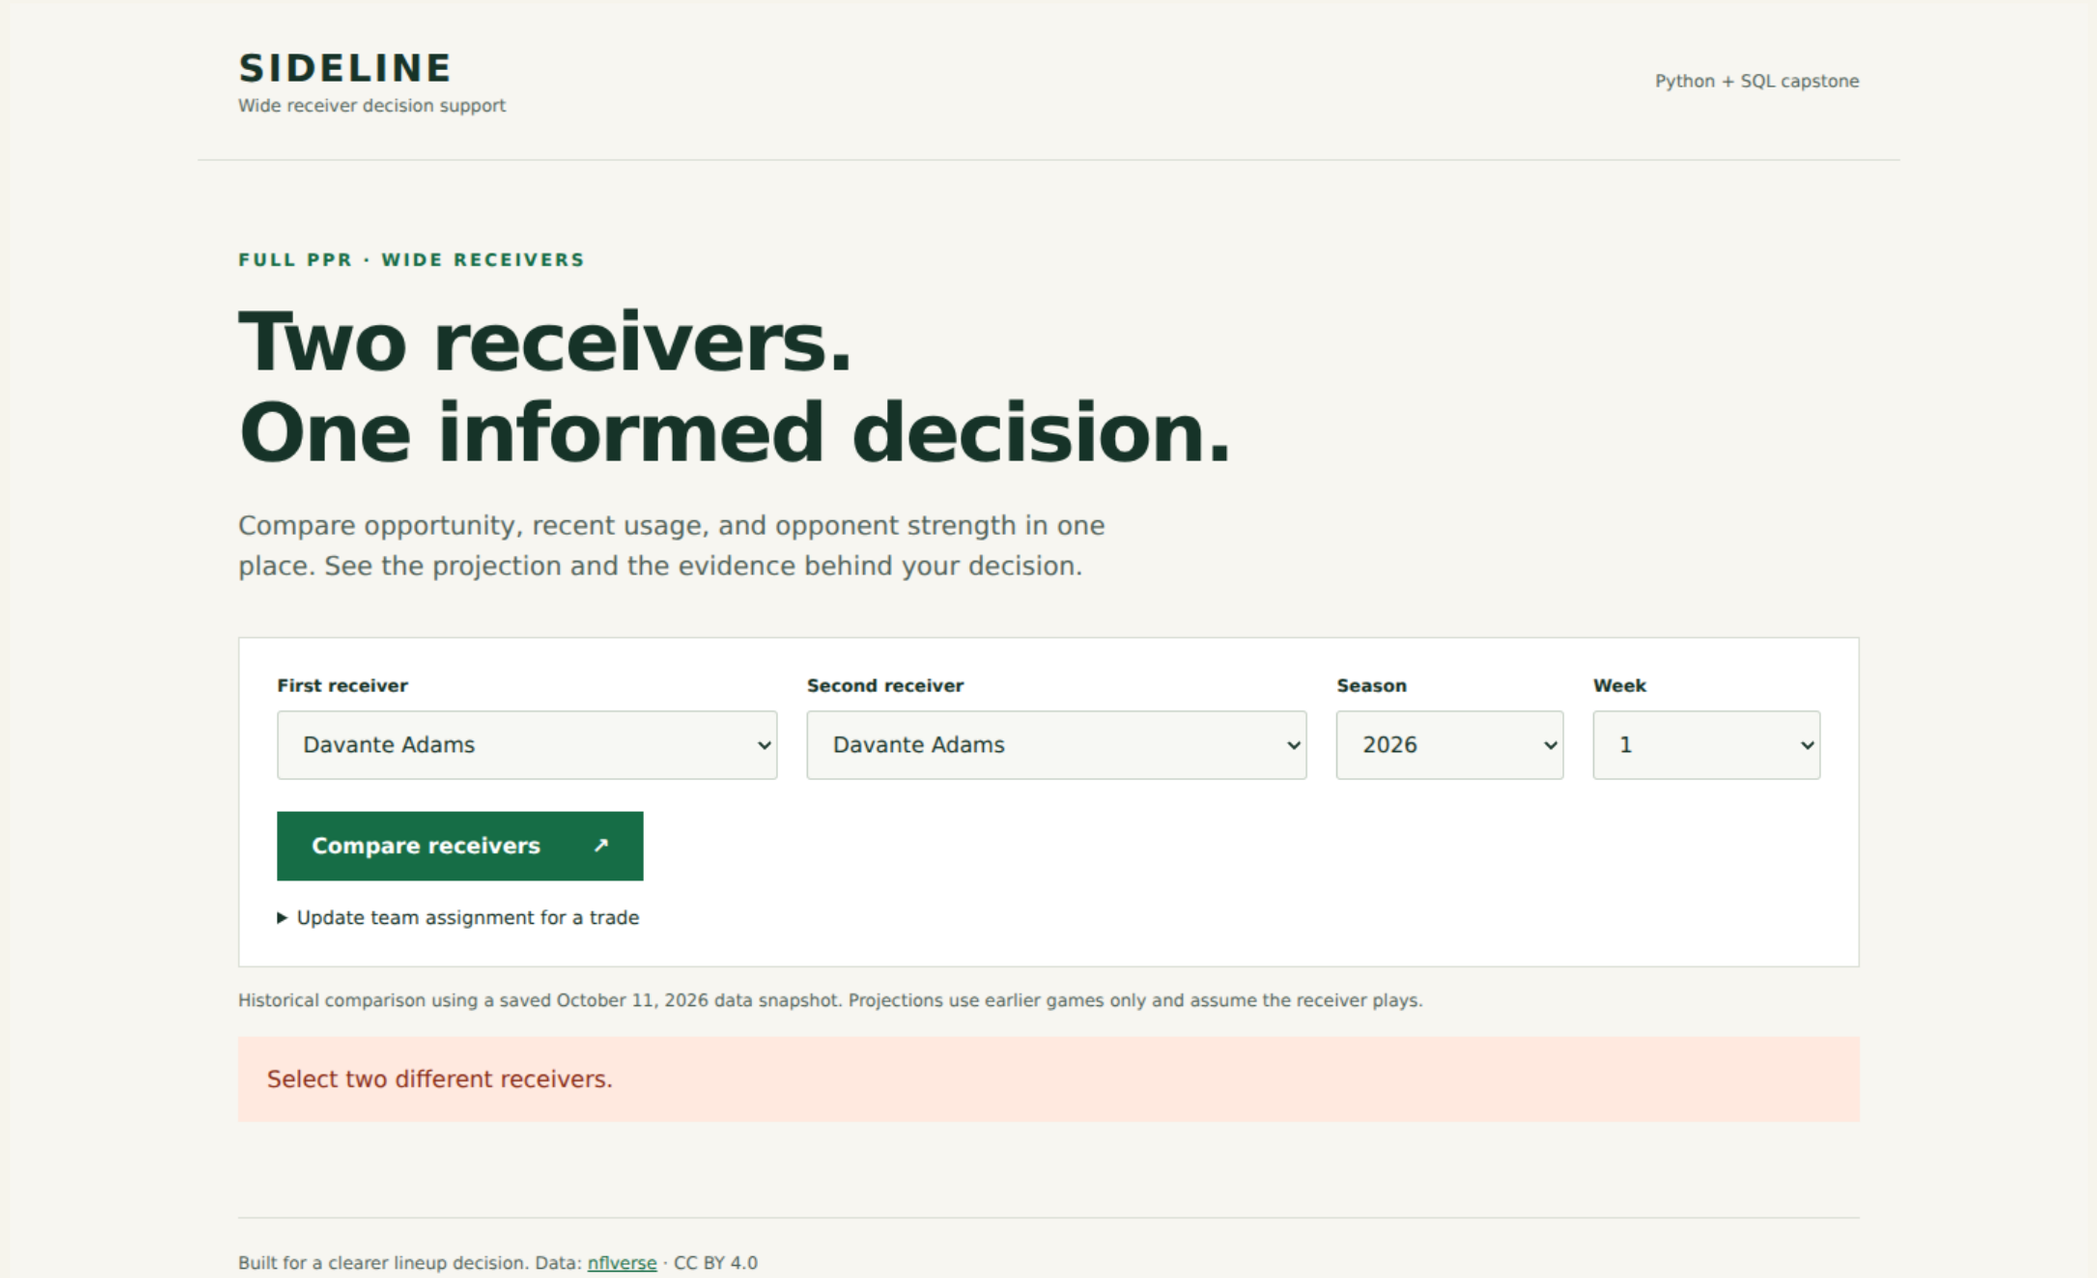

2025 provides the chronological validation sample. 2026 is a diagnostic replay because some outcomes were inspected earlier. Evaluation covers receivers with sufficient prior history and recorded stats or positive offensive snaps, conditional on participation.

Input weeks: Davante Adams: 2025-W15, 2025-W14, 2025-W13, 2025-W12, 2025-W11, 2025-W10, 2025-W9, 2025-W7; Matthew Golden: 2025-W18, 2025-W17, 2025-W16, 2025-W15, 2025-W14, 2025-W11, 2025-W9, 2025-W8.

The interface explains feature cutoff, model evaluation and unavailable route, injury and archived weather inputs.

Input validation

Sideline | Implementation snapshot: October 11, 2026

Selecting the same receiver twice produces an error instead of a misleading comparison.
